

Assignment 8 - Gui mockup and test cases

A note about this assignment:

Due to the scope of this assignment, the rule of attempt is adjusted. Instead of having an attempt grade, each week will focus on evaluating one part of this assignment for a total of 5 points per section (GUI mock-up and test cases).

Meaning that you would defend in both weeks. The first week is for testing, while the second being for the GUI mock-up

However, if the team has managed to **complete** the creation of everything related to this **assignment early**, then you can **defend both parts at the same time**.

Test case (First submission week)

Create a set of test cases and the test case guidelines

- The test cases created must cover the initial non-trivial use case scenarios you created in your documentation (not counting the ones for the bonus point).
- The test case guideline is an overview of how the tests are created.

Attached to this assignment is the test case template and the test case guidelines that you can use

1-TEST CASE - CDC_UP_Test_Case_Template.doc

2-TestGuide-Temp.docx

For more information on how to create a test case, please refer to the following link →

[Guidelines : test case](#)

Example test cases can also be found attached to this assignment.

For one additional point: Create **test cases** for the remaining use cases scenario in your documentation (if you created additional ones in your documentation)

For the submission → please submit all the **test cases** created for this assignment.

Gui mock-up (Second submission week)

Create the Gui mock up for your application.

- The gui mock ups should be focused on showcasing the use-case scenario created during the documentation (you only need to do the initial non-trivial use case scenarios)
- Update the documentation with your GUI Mock up and introduce the GUI discussion section.

For an example of how to update your document, please refer to the hobby store document added to this assignment.

You can use any gui mockup tool (Figma, Marvel app, etc) you prefer for the creation of the GUI mockup.

However, if you are not familiar with any, a tutorial video can be found here on

how to use the Marvel app. Link to tutorial → [Marvel app introduction](#)

Do note that the video showcases how to create **interactions** for the **mock website**. However, that is **not mandatory** for your assignment. **Updating** the **documentation** with the appropriate images **is sufficient** for this submission.

For one additional point: Create the **GUI Mockup** for the remaining use cases scenario in your documentation (if you created additional ones in your documentation)

For the submission → please submit the **updated documentation** of your project

Additionally, a **version of the hobby store documentation without any notes** can be found attached to this assignment. This additional documentation is added to **showcase the final structure of the documentation** that your own project should follow.
